The invention relates to methods and compositions for regulating Rop (RHO -like small G-protein of plant) GTPase activity in plant. The invention also relates to RopGAP (GTPase activating protein) polypeptide which inactivates Rop GTPase signaling and comprises of a CGG42/Rac-interactive binding (CRIB) motif and a GAP domain. The methods and compositions of the invention are useful for regulating Rop GTPase activity in a plant. The invention is useful for inducing expression of a particular RopGAP nucleic acid to enhance or increase endogenous gene expression. Enhanced expression can therefore be used to control plant phenotypes by controlling Rop GTPase activity under RopGAP's control in desired tissues, cells or subcellular locations. The present sequence is an antioxidant response element (ARR) consenus oligonuclectide. This sequence is used to illustrate the method of the invention.
                                                                                                                                                                                                                     New nucleic acid comprising a heterologous plant promoter operably l
to a polynucleotide encoding a dominant negative RopGAP polypeptide,
useful for regulating Rop GTPase activity in plants.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to methods and compositions for regulating Rop (RHO-like small G-protein of plant) GTPase activity in plant. The invention also relates to RopGAP (GTPase activating protein) polypeptide which innactivates Rop GTPase signaling and comprises of a Cdc42/Rac-interactive binding (CRIB) motif and a GAP domain. The methods and compositions of the invention are useful for regulating Rop GTPase activity in a plant. The invention is useful for inducing expression of a particular RopGAP mucleic acid to enhance or increase endogenous gene expression. Enhanced expression can therefore be used to control plant phenotypes by controlling Rop GTPase activity under RopGAP's control in desired tissues, cells or subcellular locations. The present sequence is an antioxidant response element (RRE) consensus oligonucleotide. This sequence is used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                             New nucleic acid comprising a heterologous plant promoter operably linked to a polynucleotide encoding a dominant negative RopGAP polypeptide, useful for regulating Rop GTPase activity in plants.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  g
                                                                                                                                                                                                       The invention relates to an agent that modulates a megakaryocytic acute leukemia (MAL) activity. The agent or the polynucleotide that encodes the agent is useful for combating a disorder in an individual by modulating cancer such as leukemia, particularly childhood leukemia AML-N7, wounds, myopathies such as leukemia, particularly childhood leukemia AML-N7, wounds, myopathies such as muscle hypertrophy, and any disorder that would myopathies such as muscle hypertrophy, in cancer, the agent combats tumor cell growth, adhesion, cellular mobility, invasion or metastasis. The agent may be administered as a polynucleotide The agent or the polynucleotide that encodes the agent is useful in medicine and in the manufacture of a medicament for combating the disorders above. The agents, its encoding polynucleotide or the genetic construct is useful for modulating an activity of MAL in vitro. This sequence corresponds to the SRF binding site used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                     useful for combating e.g., cancer, particularly acute myeloid leukemia (AML-M7), wounds, or myopathies such as muscle hypertrophy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          megakaryocytic acute leukemia modulator; MAL modulator; MAL stimulator; MAL inhibitor; MAL binding agent; serum response factor modulator; SRF simulator; SRF inhibitor; SRF binding agent; actin binding agent; antisense; RNA; megakaryocytic acute leukemia; cancer; leukemia; wounds; myopathy; muscle hypertrophy; anglogenesis;

The invention relates to an agent that modulates a megakaryocytic acute leukemia (MAL) activity. The agent or the polynucleotide that encodes the agent is useful for combating a disorder in an individual by modulating (either inhibiting or stimulating) a MAL activity, where the disorder is cancer such as leukemia, particularly childhood leukemia AML-M7, wounds, benefit from enhanced angiogenesis. In cancer, the agent combats tumor cell growth, adhesion, cellular mobility, invasion or metastasis. The polynucleotide that eacodes the agent contact the polynucleotide that encodes the agent or the polynucleotide that encodes the agent or the polynucleotide that encodes the agent or the agent contact of a medicament for combating the disorders above. The agents, its encoding polynucleotide or the genetic construct of a medicament for combating the disorders above. The for modulating an activity of MAL in vitro. This sequence corresponds to the SRF binding site used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Integrating a DNA sequence into the genome of a vertebrate host cell, comprises introducing a construct comprising the DNA sequence and a recombination region homologous to a consensus defined flanking region of a short interspersed repeated DNA element (SINE), e.g. the present sequence. The method may be used to modify the phenotype of cells, or investigate the response of receptors, metabolic pathways or expression products involved in the regulation of transcription or transduction of signals. It may also be used to produce protein products and transgenic animals, by providing novel capabilities to the cells or inhibiting endogenous capabilities, investigate physiological indications and screen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Genomic integration of DNA by site directed recombination - using construct containing recombination region homologous to consensus defined flanking region of short interspersed repeated DNA element.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  comprises introducing a construct comprising the DNA sequence and a recombination region homologous to a consensus defined flanking region of a short interspersed repeated DNA element (SIRE), e.g. the present sequence. The method may be used to modify the phenotype of cells, or investigate the response of receptors, metabolic pathways or expression products involved in the regulation of transcription or transduction of signals. It may also be used to produce protein products and transgenic animals, by providing novel capabilities to the cells or inhibiting endogenous capabilities, investigate physiological indications and screen cosmetics, foods and drugs. By using antisense sequences effective inhibition of both copies of a gene is possible, ensuring the substantial absence of the particular transcriptional or translational product. In
            inhibition of both copies of a gene is possible, ensuring the substantial absence of the particular transcriptional or translational product. In addition the method may enhance efficiency in gene therapy, when providing for a capability in which the host is deficient
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Genomic integration of DNA by site directed recombination - using construct containing recombination region homologous to consensus defined flanking region of short interspersed repeated DNA element.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Integrating a DNA sequence into the genome of a vertebrate host cell,

```

```
The invention relates to diagnosing a genetic susceptibility for a disease, condition, or disorder in a subject that comprises analysing a nucleotide acid in a biological sample to detect the presence of a single mucleotide polymorphism (SNP) in the endothelial consecutive nitric oxide synthase (ecNoS) gene. The SNP is associated with a disease, condition or disorder selected from breast cancer, lung cancer, prostate cancer, non-insulin dependent diabetes, end stage renal disease due to non-insulin dependent diabetes, end stage renal disease due to non-insulin dependent diabetes or hypertension, hypertension, myocardial infarction, colon cancer, atherosclarotic peripheral vascular disease, alcanacts, cerebrovascular accident, cardiomyopathy with hypertension, ischaemic cardiomyopathy, atrial fibrillation without valvular disease, alcohol abuse, anxiety, astham, cholecystectomy, chronic obstructive pulmonary disease, angered is useful for diagnosing a genetic predisposition to a disease associated with SNPs, for designing a treatment regimen for a disease associated with SNPs, for designing a treatment regimen for a patient having a disease, condition or more SNPs. The present sequence indirectly by the presence of one or more SNPs. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Diagnosing a genetic susceptibility for a disease, condition, or disorder in a subject comprises detecting the presence of a single nucleotide polymorphism in the endothelial consecutive nitric oxide synthase gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Single nucleotide polymorphism; SNP; ecNOS; cytostatic; anti-diabetic; endothelial consecutive nitric oxide synthase; nephrotropic; hypotensive; cardiant; anti-atherosclerotic; vasoconstrictor; ophthalmalogical; human; tranquillizer; anxiolytic; anti-asthmatic; sedative; antiinflammatory; anticoagulant; osteopathic; cancer; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        a "SNP replaces the G in the core binding site with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human ecNOS gene nuclear factor Y (NFY_Q6) binding site DNA fragment.

The invention relates to diagnosing a genetic susceptibility for a disease, condition, or disorder in a subject that comprises analysing a nucleic acid in a biological sample to detect the presence of a single nucleotide polymorphism (SNP) in the endothelial consecutive nitric oxide synthase (ecNOS) gene. The SNP is associated with a disease, condition or disorder selected from breast cancer, lung cancer, prostate cancer, non-insulin dependent diabetes, end stage renal disease due to non-insulin dependent diabetes or hypertension, hypertension, wycardial infarction, colon cancer, atherocalerotic peripheral vascular disease, cataracts, cerebrovascular accident, cardiomyopathy with hypertension, ischaemic cardiomyopathy, atrial fibrillation without valvular disease, alcohol caduse, anxiety, asthma, cholecystectomy, chronic observor; pulmonary disease, degenerative joint disease cancer to electer and selzure colon cancer, and with SNPs, for designing a genetic predisposition to disorder. The method is useful for diagnosing a genetic predisposition to patient having a disease, condition or disorder caused either directly or indirectly by the presence of one or more SNPs. The present sequence

```
The invention relates to a method of identifying (MI) a peptide aptamer (PA) capable of modifying a cell phenotype, involving contacting a lst cample of cells with a library of expressible nucleic acid sequences canding random peptide aptamers linked to a fusion moiety, selecting at encoding random peptide aptamers linked to a fusion moiety, selecting at least one cell having an altered phenotype compared to the phenotype of the cell prior to contacting, and identifying peptide aptamers expressed in the selected cell. PA, its derivative or corresponding nucleic acid is useful for the molecular modelling of an agent having similar binding contaracteristics as PA, PA, its derivative or corresponding expressible contacted caid is useful for treating or inhibiting a disease or condition where the aberrant cell phenotype is associated with a change in levels of apoptosis, viral resistance, signal transduction, protein trafficking, cell adhesion, membrane transport, cell motility, metabolic state or differentiation, when compared to a control cell, or the aberrant cell phenotype is associated with a tumor cell. The expressible nucleic acid is administered using a retrovirus that comprises a chromatin insulator cell phenotype, in gene therapy, as therapeutics for treating diseases (such as pain, epilepsy, stroke, parkinson's disease, Alzheimer's cell phenotype, in gene therapy, as therapeutics for treating diseases (such as pain, epilepsy, stroke, Parkinson's disease, Alzheimer's cell phenotype, in gene therapy, as the peptide disease, multiple sclerosis, AlbS), and diseases, multiple sclerosis, AlbS), and diseases, thurinington's diseases, multiple sclerosis, AlbS), and diseaser, the end of the inserted sequence used to express the peptide dispalay the end of the inserted sequence used to express the peptide dispalay.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Identifying peptide aptamer capable of modifying cell phenotype, by contacting cell sample with library encoding random peptide aptamers, selecting cell with altered phenotype, and identifying aptamers expressed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Example 1; SEQ ID NO 5; 173pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a method of identifying (M1) a peptide aptamer (PA) capable of modifying a cell phenotype, involving contacting a 1st sample of cells with a library of expressible mucleic acid sequences encoding random peptide aptamers linked to a fusion moiety, selecting at encoding random peptide aptamers expressed to the phenotype of the cell prior to contacting, and identifying peptide aptamers expressed in the selected cell. PA, its derivative or corresponding nucleic acid is useful for the molecular modelling of an agent having similar binding characteristics as PA. PA, its derivative or corresponding expressible nucleic acid is useful for treating or inhibiting a disease or condition (such as cancer) associated with an aberrant cell phenotype in a subject, where the aberrant cell phenotype is associated with a change in levels or appropriate, viral resistence, signal transduction, protein trafficking, cell adhesion, membrane transport, cell motility, metabolic state or differentiation, when compared to a control cell, or the aberrant cell phenotype is associated with a tumor cell. The expressible nucleic acid is administered using a retrovirus that comprises a chromatin insulator clament. PA is useful as a prognostic or diagnostic tool, for altering a cell phenotype, in gene therapy, as therapeutics for treating diseases
                                                                                ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Identifying peptide aptamer capable of modifying cell phenotype, by contacting cell sample with library encoding random peptide aptamers, selecting cell with altered phenotype, and identifying aptamers expressed

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This sequence represents an oxygen dependent repressor (ODR) element. This sequence is specifically bound by the repressor ROX-1. The sequence is suitable for inclusion in a vector construct that is useful in the invention. In this vector the ODR element is under the control of an SV-40 promoter. This vector induces (under the right conditions) synthesis of a cytoxoxic peptide product. The cytoxic peptide product is The order of a cytoxic peptide product is The order of a cytoxic peptide product is The order of this vector is that it provides a more versatile approach to selective killing of regions of hypoxic cells
(such as pain, epilepsy, stroke, Parkinson's disease, Alzheimer's disease, Huntington's disease, multiple sclerosis, AIDS), and for the research and development of other therapeutics. This sequence represents the end of the inserted sequence used to express the peptide display library (in retroviruses) and used to generate the aptamers of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        solid tumour than hyperthermic treatment of cells. (Updated on 25-MAR.) to correct PN field.)

Integrating a DNA sequence into the genome of a vertebrate host cell, comprises introducing a construct comprising the DNA sequence and a recombination region homologous to a consensus defined flanking region of a short interspersed repeated DNA element (SINE), e.g. the present cashort interspersed repeated DNA element (SINE), e.g. the present cashort interspersed repeated DNA element (SINE), e.g. the present consensus interspersed repeated DNA element (SINE), e.g. the present consensus involved in the regulation of transcription or transduction of products involved in the regulation of transcription or transduction of signals. It may also be used to produce protein products and transgenic canimals, by providing novel capabilities to the cells or inhibiting endogenous capabilities, investigate physiological indications and screen cosmetics, foods and drugs. By using antisense sequences effective inhibition of both copies of a gene is possible, ensuring the substantial absence of the particular transcriptional or translational product. In addition the method may enhance efficiency in gene therapy, when
                                                                                                                                                                                                                                                                                                                      Genomic integration of DNA by site directed recombination - using construct containing recombination region homologous to consensus defined flanking region of short interspersed repeated DNA element.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               / Match 30.0%; Score 3; DB 2; Length 12; Local Similarity 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence represents an oxygen dependent repressor (ODR) element. This sequence is specifically bound by the repressor ROX-1. The sequence is substance inclusion in a vector construct that is useful in the invention. In this vector the ODR element is under the control of an SV-40 promoter. This vector induces (under the right conditions) synthesis of a cytotoxic peptide product. The cytotoxic peptide product is than Necrosis Factor (TNR). The advantage of this vector is that it provides a more versatile approach to selective killing of regions of hypoxic cells in solid tumour than hyperthermic treatment of cells.                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                    Integrating a DNA sequence into the genome of a vertebrate host cell, comprises introducing a construct comprising the DNA sequence and a recombination region homologous to a conseasus defined flanking region of a short interspersed repeated DNA element (SIME), e.g. the present sequence. The method may be used to modify the phenotype of cells, or investigate the response of receptors, metabolic pathways or expression products involved in the regulation of transcription or transduction of signals. It may also be used to produce protein products and transgenic animals, by providing novel capabilities to the cells or inhibiting endogenous capabilities, investigate physiological indications and screen cosmetics, foods and drugs. By using antisense sequences effective inhibition of both copies of a gene is possible, ensuring the substantial absence of the particular transcriptional or translational product. In
                                              Genomic integration of DNA by site directed recombination - using construct containing recombination region homologous to consensus defined flanking region of short interspersed repeated DNA element.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Genomic integration of DNA by site directed recombination - using construct containing recombination region homologous to consensus defined flanking region of short interspersed repeated DNA element.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Integrating a DNA sequence into the genome of a vertebrate host cell,
                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                        addition the method may enhance efficiency in gene therapy, when providing for a capability in which the host is deficient

a short interapersed repeated DNA element (SIME), e.g. the present sequence. The method may be used to modify the phenotype of cells, or privestigate the response of receptors, metabolic pathways or expression products involved in the regulation of transcription or transduction of signals. It may also be used to produce protein products and transgenic animals, by providing novel capabilities to the cells or inhibiting endogenous capabilities, investigate physiological indications and screen commetics, foods and drugs. By using antisense sequences effective inhibition of both copies of a gene is possible, ensuring the substantial absence of the particular transcriptional or translational product. In addition the method may enhance efficiency in gene therapy, when providing for a capability in which the host is deficient
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Integrating a DNA sequence into the genome of a vertebrate host cell, comprises introducing a construct comprising the DNA sequence and a recombination region homologous to a consensus defined flanking region of a short interspersed repeated DNA element (SINE), e.g. the present sequence. The method may be used to modify the phenotype of cells, or investigate the response of receptors, metabolic pathways or expression products involved in the regulation of transcription or transduction of signals. It may also be used to produce protein products and transgenic animals, by providing novel capabilities to the cells or inhibiting endogenous capabilities, investigate physicalogical indications and screen cosmetics, foods and drugs. By using antisense sequences effective inhibition of both copies of a gene is possible, ensuring the substantial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Genomic integration of DNA by site directed recombination - using construct containing recombination region homologous to consensus defined flanking region of short interspersed repeated DNA element.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to 691 Arabidopsis thaliana genes (ADG87559--
ADG87557)) whose expression is altered in response to pathogen infection,
and to homologues of these genes from other plants or fungi, especially
from maize, soybean, barley, alfalfa, sunflower, canola (cilseed rape),

ô
identifying plants infected with a pathogen, and for conferring resistance to pathogens such as convectes, fund, bacteria, viruses, neamotodes and insects (e.g., aphids). The present sequence represents a consensus sequence for cis elements from the promoters of Arabidopsis parasitica shose expression is altered in response to Peronospora parasitica infection. Note: The sequence data for this patent can also be obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Pathogen infection-related gene; plant; Peronospora parasitica; defence mechanism; pathogen resistance; transgenic plant; oomycete; fungus; bacterium; virus; nematode; insect; aphid; promoter; cis element;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to 691 Arabidopsis thaliana genes (ADG87559--ADG87557) whose expression is altered in response to pathogen infection, and to homologues of these genes from other plants or fungi, especially from maize, soybean, barley, alfalfa, sunflower, canola (oilseed rape), cotton, peanut, sorghum, tobacco, sugarbeet, rice or wheat. The cotton, peanut, sorghum, tobacco, sugarbeet, rice or wheat. The Arabidopsis plants infected with the comycete Peronespora parasitica, indicating that they play a role in defence mechanisms. The genes of the invention are regulated by RPP7 or RRP8 which act via unconventional
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel isolated polynucleotide, useful for conveying pathogen resistance to plants, and for identifying plants infected with a pathogen.
                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Pathogen infection-related gene consensus motif 1 cis element #697.

applications including the study of gene function and the creation of disease models, as well as gene therapy for medical applications, and the design of economically important animals and crops. Furthermore, the phiC31 integrase of the invention is useful for preparing an agent for recombining a DNA molecule containing phiC31 integrase recognition sequences in a eukaryotic cell, a vertebrate or transgenic organism. This oligonuclectide sequence is bacteriophage phiC31 integrase consensus splice accpetor site (SeqID 3) of the invention.

This invention relates to novel genetically engineered nucleic acid molecules encoding phiC31 integrase (C31-Int), which has been codon optimized for expression in enkaryotic hest cells. The phiC31 integrase is a site specific recombinate (S3) that catalyzes recombination between two phiC31 recognition sequences. The introduction of silent mutations though the respective host, which in turn alters expression frequently used in the respective host, which in turn alters expression levels. Accordingly, using this ability to generate controlled and permanent modifications in eukaryotic genomes has various research spplications including the study of gene function and the creation of disease models, as well as gene therapy for medical applications, and the design of economically important animals and crops. Purthermore, the phiC31 integrase of the invention is useful for preparing an agent for recombining a DNA molecule containing phiC31 integrase consensus. This oligonucleotide sequence is bacteriophage phiC31 integrase consensus

This invention relates to novel genetically engineered nucleic acid molecules encoding phiC31 integrase (C31-Int), which has been codon optimised for expression in eukaryotic host cells. The phiC31 integrase is a site specific recombinase (SSR) that catalyzes recombination between two phiC31 recognition sequences. The introduction of silent mutations into the coding sequence changes the given codon to one that is most frequently used in the respective host, which in turn alters expression levels. Accordingly, using this ability to generate controlled and permanent modifications in eukaryotic genomes has various research

This invention relates to novel genetically engineered nucleic acid
molecules encoding phic31 integrase (C31-Int), which has been codon
coptimized for expression in eukaryotic host cells. The phiC31 integrase
c is a site specific recombinase (SSR) that catalyzes recombination between
two phiC31 recognition sequences. The introduction of silent mutations
c into the coding sequence changes the given codon to one that is most
frequently used in the respective host, which in turn alters expression
c levels. Accordingly, using this ability to generate controlled and
permanent modifications in eukaryotic genomes has various research
c permanent modifications in eukaryotic genomes has various research
c permanent modifications in eukaryotic genomes has various research
c design of economically important animals and crops. Furthermore, the
c design of economically important animals and crops. Furthermore, the
c phiC31 integrase of the invention is useful for preparing an agent for
c recombining a DNA molecule containing phiC31 integrase consensus
c poligonucleotide sequence is bacteriophage phiC31 integrase consensus
c splice acceptor site (SeqID 4) of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New genetically engineered nucleic acid molecule, useful for preparing an agent for recombining a DNA molecule containing phiC31 integrase recognition sequences in a eukaryotic cell, a vertebrate or transgenic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                           comprises introducing a construct comprising the DNA sequence and a recombination region homologous to a consensus defined flanking region of a short interspersed repeated DNA element (SINE), e.g. the present sequence. The method may be used to modify the phenotype of cells, or investigate the response of receptors, metabolic pathways or expression products involved in the regulation of transcription or transduction of alignals. It may also be used to produce protein products and transgenic animals, by providing novel capabilities to the cells or inhibiting endogenous capabilities, investigate physiological indications and screen cosmetics, foods and drugs. By using antisense sequences effective inhibition of both copies of a gene is possible, ensuring the substantial absence of the particular transcriptional or translational product. In providing for a capability in which the host is deficient
                                                                                                                                                                                                                                                                                                                  Genomic integration of DNA by site directed recombination - using construct containing recombination region homologous to consensus defined flanking region of short interspersed repeated DNA element.
                                                                                                                                                                                                                                                                                                                                                                                    Integrating a DNA sequence into the genome of a vertebrate host cell,

Integrating a DNA sequence into the genome of a vertebrate host cell, comprises introducing a construct comprising the DNA sequence and a crecombination region homologous to a consensus defined flanking region of a short interspersed repeated DNA element (SINE), e.g. the present investigate the response of receptors, metabolic pathways or expression products involved in the response of receptors, metabolic pathways or expression products involved in the regulation of transcription or transduction of signals. It may also be used to produce protein products and transgenic animals, by providing novel capabilities to the cells or inhibiting endogenous capabilities, investigate physiological indications and screen cosmetics, foods and drugs. By using antisense sequences effective inhibition of both copies of a gene is possible, ensuring the substantial absence of the particular transcriptional or translational product. In addition the method may enhance efficiency in gene therapy, when
                                                                                                                                                                                                                                                                                                                                                                                           Genomic integration of DNA by site directed recombination - using construct containing recombination region homologous to consensus defined flanking region of short interspersed repeated DNA element.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

Claim 7; Col 17-18; 12pp; English.

```
Integrating a DNA sequence into the genome of a vertebrate host cell, comprises introducing a construct comprising the DNA sequence and a recombination region homologous to a consensus defined flanking region of a short interspersed repeated DNA element (SINE), e.g. the present careful the method may be used to modify the phenotype of cells, or investigate the response of receptors, metabolic pathways or expression products involved in the regulation of transcription or transduction of signals. It may also be used to produce protein products and transgenic animals, by providing novel capabilities to the cells or inhibiting endogenous capabilities, investigate physiological indications and screen cosmetics, foods and drugs. By using antisense sequences effective inhibition of both coopies of a gene is possible, ensuring the substantial absence of the particular transcriptional or translational product. In capability in which the host is deficient

                                                                                                                                                                                                                                                                                                                                            Integrating a DNA sequence into the genome of a vertebrate host cell, comprises introducing a construct comprising the DNA sequence and a a recombination region homologous to a consensus defined flanking region of a short interspersed repeated DNA element (SINE), e.g. the present sequence. The method may be used to modify the phenotype of cells, or investigate the response of receptors, metabolic pathways or expression products involved in the regulation of transcription or transduction of signals. It may also be used to produce protein products and transgenic animals, by providing novel capabilities to the cells or inhibiting endogenous capabilities, investigate physiological indications and screen cosmetics, foods and drugs. By using antisense sequences effective inhibition of both copies of a gene is possible, ensuring the substantial absence of the particular transcriptional or translational product. In addition the method may enhance efficiency in gene therapy, when
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                               Genomic integration of DNA by site directed recombination - using construct containing recombination region homologous to consensus defined flanking region of short interspersed repeated DNA element.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

reveal the function of a gene that produced differential product between genotypes. The method is also useful for identifying PCR reactions that contain a gene of interest in a gene family reverse transcriptase (RT)-PCR expression analysis. The method is also useful for identifying genes that belong to a gene family that might be involved in cancer formation. The method is particularly useful for comparing genomic sequences. These are also applicable in agriculture (e.g. to mark useful genes to assist sequence. This is used in DNA fingerprinting using primers or a mix of primers that match the sequence of ubiquitous cis-acting regulatory elements. (Updated on 29-AUG-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a polymerase chain reaction (PCR) based method of DNA fingerprinting, comprising using primers that match the conserved regions of a gene family. The method is useful for gene expression analysis of any cell or tissue, or for the performance of DNA fingerprinting analysis of the same organism in order that one will reveal the function of a gene that produced differential product between genotypes. The method is also useful for identifying PCR reactions that contain a gene of interest in a gene family reverse transcriptase (RT)-PCR expression analysis. The method is also useful for identifying genes that belong to a gene family that might be involved in cancer formation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              containing decoy oligonucleotides binding
The method is particularly useful for comparing genomic sequences. These are also applicable in agriculture (e.g. to mark useful genes to assist breeding). The current sequence represents an animal cis-regulatory sequence. This is used in DNA fingerprinting using primers or a mix of primers that match the sequence of ubiquitous cis-acting regulatory elements. (Updated on 29-AUG-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                            anticancer agent; cancer; decoy oligonucleotide; transcriptional factor; YB-1 gene; ds; Y-box.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention comprises an anticancer agent containing decoy oligonuclectides which bind to transcriptional factors of the YB-1 gene. The decoy oligonuclectides selectively suppress the growth of cancer cells without affecting normal cells. The present DNA sequence was used in the exemplification of the invention.

Identifying RNA ligands that bind to a target molecule comprises treating a first pool of RNA ligands that collectively bind more than one target to reduce the concentration or eliminate the presence of target-binding
                                                                                                                                                                                                                                                                                The present invention relates to a method of identifying RNA ligands that bind to a target molecule, comprising treating a first pool of RNA ligands that collectively bind more than one target under conditions effective to reduce the concentration or eliminate the presence of one or more predominate target-binding RNA ligands from the first pool of RNA ligands. In particular, the method can be used to identify RNA aptamers capable of binding to heat shock factor protein. The present sequence is a DNA sequence shown in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Identifying RNA ligands that bind to a target molecule comprises treating a first pool of RNA ligands that collectively bind more than one target to reduce the concentration or eliminate the presence of target-binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a method of identifying RNA ligands that

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention comprises an anticancer agent containing decoy oligomucleotides which bind to transcriptional factors of the YB-1 gene. The decoy oligonucleotides selectively suppress the growth of cancer cells without affecting normal cells. The present DNA sequence was used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        HIV protease function is inhibited by DNA oligonucleotides which include one of the sequences 5'-AANGT, S'-AANGGA, S'-AGTGTG, S'-TRGATNY, S'-CCTC, S'-GGTGNA or one of the sequences in AAQ80973- AAQ80976. Oligonucleotides contg. these sequences are found to bind to HIV protease and so prevent HIV maturation. Prefd. oligo-deoxyribonucleotides are classified into classes D (AAQ80977-Q80987), E (AAQ80988-Q80990) and F (AAQ80991-Q80995) and can be single-or double-stranded or in the form of a stem-loop structure, a pseudoknot or a closed, circular structure. In addition to their potential use in gene therapy, the oligonucleotides will be useful as diagnostic probes to detect HIV infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                        Inhibiting HIV protease function with specific oligonucleotides - which bind to the enzyme, for treating or preventing HIV infection, including use of vectors in gene therapy.

HIV protease function is inhibited by DNA oligonucleotides which include one of the sequences 5'-AANGT, 5'-AANGGA, 5'-AGTGGG, 5'-TNGATNY, 5'-CCTC, 5'-GGTGNA or one of the sequences in AAQ80973- AAQ80976. Oligonucleotides contg. these sequences are found to bind to HIV protease and so prevent HIV maturation. Prefd. oligo-deoxyribonucleotides are classified into and can be single-or double-stranded or in the form of a stem-loop structure, a pseudoknot or a closed, circular structure. In addition to their potential use in gene therapy, the oligonucleotides will be useful as diagnostic probes to detect HIV infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                             Inhibiting HIV protease function with specific oligonucleotides - which bind to the enzyme, for treating or preventing HIV infection, including use of vectors in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                   Integrating a low bequence into comprising the DNA sequence and a recomprises introducing a construct comprising the DNA sequence and a recompination region homologous to a consensus defined flanking region of a short interspersed repeated DNA element (SINE), e.g. the present sequence. The method may be used to modify the phenotype of cells, or investigate the response of receptors, metabolic pathways or expression products involved in the regulation of transcription or transduction of signals. It may also be used to produce protein products and transgenic animals, by providing novel capabilities to the cells or inhibiting endogenous capabilities, investigate physiological indications and screen consections, foods and drugs. By using antisense sequences effective inhibition of both copies of a gene is possible, ensuring the substantial absence of the particular transcriptional or translational product. In
                                                 Genomic integration of DNA by site directed recombination - using construct containing recombination region homologous to consensus defined flanking region of short interspersed repeated DNA element.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Genomic integration of DNA by site directed recombination - using construct containing recombination region homologous to consensus defined flanking region of short interspersed repeated DNA element.

The method may be used to modify the phenotype of cells, or investigate the response of receptors, metabolic pathways or expression products involved in the regulation of transcription or transduction of signals. It may also be used to produce protein products and transgenic animals, by providing novel capabilities to the cells or inhibiting endogenous capabilities, investigate physicalogical indications and screen cosmetics, foods and drugs. By using antisense sequences effective inhibition of both copies of a gene is possible, ensuring the substantial
recombination region homologous to a consensus defined flanking region of a short interspersed repeated DNA element (SINB), e.g. the present sequence. The method may be used to modify the phenotype of cells, or investigate the response of receptors, metabolic pathways or expression products involved in the regulation of transcription or transduction of signals. It may also be used to produce protein products and transgenic animals, by providing novel capabilities to the cells or inhibiting endogenous capabilities, investigate physiological indications and screen cosmetics, foods and drugs. By using antisense sequences effective inhibition of both copies of a gene is possible, ensuring the substantial absence of the particular transcriptional or translational product. In
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Genomic integration of DNA by site directed recombination - using construct containing recombination region homologous to consensus defined flanking region of short interspersed repeated DNA element.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           addition the method may enhance efficiency in gene therapy, when providing for a capability in which the host is deficient

Integrating a DNA sequence into the genome of a vertebrate host cell, comprises introducing a construct comprising the DNA sequence and a recombination region homologous to a consensus defined flanking region of a short interspersed repeated DNA element (SINE), e.g. the present a short interspersed repeated DNA element (SINE), e.g. the present investigate the response of receptors, metabolic pathways or expression products involved in the regulation of transcription or transduction of signals. It may also be used to produce protein products and transgenic animals, by providing novel capabilities to the cells or inhibiting endogenous capabilities, investigate physiological indications and screen consection, foods and drugs. By using antisense sequences effective inhibition of both copies of a gene is possible, ensuring the substantial absence of the particular transcriptional or translational product. In addition the method may enhance efficiency in gene therapy, when

The present sequence represents an ISRE gene promoter motif found in a trophoblast STAT utron (TSU). TSUS be isolated from a CDNA library problast STAT utron (TSU). TSUS be isolated from a CDNA library crown that isolated from trophoblast ceals. Utrons are from, or are homologous to, the 3' untranslated region (UTR), of an mRNA that care homologous to, the 3' untranslated region (UTR), of an mRNA that the structions. The TSU is able to suppress constitutive and interferonce interactions. The TSU is able to suppression of other antigens, the game (IRN-gamma) induced major histocompatibility complex (MHC) class I and class II antigen expression and expression of other antigens, the gene promoters of which contain related sequence motifs that are stimulated by the same factors which stimulate MHC class I and class II shighalling (GAS, ISRE and interleukin-4 response elements). The nucleic acid can be used to regulate gene expression in a subject, e.g. a human call in vitro, specifically inhibiting MHC class I or II, ICAM-7, B7-1, B7-2, FC gamma R. IL-2 or HIV gene expression. It can be used to inhibit transplant rejection, or treat an autoimmune or inflammatory considered to the season of a line ages or disorder. It can also be used to inhibit the action of STATI-

```
The present sequence represents an ISRE gene promoter motif found in a trophoblast STAT utron (TSU). TSUs be isolated from a CDNA library prepared from mRNA isolated from trophoblast cells. Utrons are from, or trimulates or inhibits a cellular response by sequence specific interactions. The TSU is able to suppress constitutive and interferongamma (IFN-gamma) induced major histocompatibility complex (MHC) class I and class II antigen expression and expression of other antigens, the gene promoters of which contain related sequence motifs that are stimulated by the same factors which stimulate MHC class I and class II antigen expression. The TSU sequence contains motifs related to IFN signalling (GAS, ISRE and interleukin-4 response elements). The nucleic acid can be used to regulate gene expression in a subject, e.g. a human cor a cell in vitro, specifically inhibiting MHC Class I or II ICAM-7, B7 in this transplant rejection, or treat an autoimmune or inflammatory is incompleted from the contains motification.
                                                                                                                                                                                                     Trophoblast STAT utron, TSU, 3' untranslated region, UTR; inhibition; interferon-gamma; IFN-gamma; major histocompatibility complex; MHC; antigen expression; gene promoter; class I; class II; FN signalling; GAS; ISRE; interleukin-4 response element; gene expression; ICAM-7; B7-1; B7-2; FC gamma R; HIV gene expression; transplant rejection; treatment; autoimmune disease; inflammatory disease; ss.

```
The present sequence represents an ISRE complement sequence found in the trophoblast STAT utrons (TSUS) of the invention. Utrons are from, or are homologous to, the 3' untranslated region (UTR), of an mRNA that catimulates or inhibits a cellular response by sequence specific interactions. The TSU is able to suppress constitutive and interferongamma (IFN-gamma) induced major histocompatibility complex (MHC) class I antigen expression and expression of other antigens, the gene promoters of which contain related sequence motifs that are stimulated by the same factors which stimulate MHC class I and class II stimulated by the same factors which stimulate MHC class I and class II stimulated by the superference contains motifs related to IFN calfornally card can be used to regulate gene expression in a subject, e.g. a human or a cell in vitro, specifically inhibiting MHC class I or II, ICAM-7, B7 classes or disporder. It can also be used to inhibit the action of STATI-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

RESULT 180 Matches AAZ43723/c 셤 ð The present sequence represents an ISRE complement sequence found in the trophoblast STAT utrons (TSUS) of the invention. Utrons are from, or are trophoblast STAT utrons (TSUS) of the invention. Utrons are from, or are homologous to, the 3' untranslated region (UTR), of an mRNA that stimulates or inhibits a cellular response by sequence specific interactions. The TSU is able to suppress constitutive and interferoncy amma) induced major histocompatibility complex (MHC) class I and class II antigen expression and expression of other antigens, the gene promoters of which contain related sequence motifs that are stimulated by the same factors which stimulate MHC class I and class II antigen expression. The TSU sequence contains motifs related to IRN signalling (GAS, ISRE and interleukin-4 response elements). The nucleic acid can be used to regulate gene expression in a subject, e.g. a human or acil in vitro, specifically inhibiting MHC class I or II, ICAM-7, B7 inhibit transplant rejection, or treat an autoimmune or inflammatory disease or disorder. It can be used to inhibit the action of STATIö Gaps ö 30.0%; Score 3; DB 2; Length 14; 100.0%; Pred. No. 0; 0; Indels 0; Mismatches AAZ43723 standard; DNA; 14 BP. ```
This invention describes a novel DNA construct (A) that alters expression of an endogenous follicle stimulating hormone (FSH)-beta gene in a mammalian cell upon integration into the genome of the cell via common described and cell upon integration into the genome of the cell via common beta express follicle-stimulating hormone beta (FSHbeta) are useful for which express follicle-stimulating hormone beta (FSHbeta) are useful for in vitro production of the protein and gene therapy. The cells are also useful as populations of homologously recombinant cell lines, as homologously recombinant primary or secondary cells, as homologously recombinant clonal cells or strains, as homologously commonly considered and the above. Such cells may be used in a delivery system for treating infertility, for enhancing fertility in a human or animal, or confirmation any other conditions treatable with FSHbeta. The polynucleotides may be used as a source of primers, and to alter the expression of an endogenous FSHbeta gene. This sequence represents a human FSH-beta gene splice-acceptor site DNA motif which is used in the control of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

                                                                                                                                                                                                                    8
                                                                                                This invention describes a novel DNA construct (A) that alters expression of an endogenous follicle stimulating hormone (RSH)-beta gene in a mammalian cell upon integration into the genome of the cell via homologous recombination. Homologously recombinant cells of the invention which express follicle-stimulating hormone beta (FSHbeta) are useful for in vitro production of the protein and gene therapy. The cells are also useful as populations of homologously recombinant cell lines, as populations of homologously recombinant clonal cells as homologously combinant heterogeneous cells are also recombinant heterogeneous cells may be used in a delivery system for treating infertulity, for enhancing fertility in a human or animal, or for treating any other conditions treatable with FSHbeta. The polynucleotides may be used as a source of primers, and to alter the expression of an endogenous FSHbeta gene. This sequence represents a chuman FSH-beta gene splice-acceptor site DNA motif which is used in the

                                                                                                                                                                                                                               The present invention relates the diagnosis of genetic susceptibility for end-stage renal disease (ESRD). The method involves analysing a polynucleotide sample for a single nucleotide polymorphism (SNP) associated with an altered susceptibility for ESRD. The method allows early detection of ESRD and hence effective delay or ideally, prevention of ESRD and pensent sequence is a SNP site found in the human TGF-b1 promoter sequence (see AAA91866). Polymorphisms in this gene are known to be a probable trigger for renal apoptosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates the diagnosis of genetic susceptibility for end-stage renal disease (ESRD). The method involves analysing a polymuclectide sample for a single nuclectide polymorphism (SNP) sasociated with an altered susceptibility for ESRD. The method allows early detection of ESRD and hence effective delay or ideally, prevention of ESRD is made possible. The present sequence is a SNP site found in the human TGF-bl promoter sequence. (see AAA91866). Polymorphisms in this gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Diagnosing genetic susceptibility for end-stage renal disease using single nucleotide polymorphisms, involves analyzing sample obtained from subject to detect genetic polymorphism in the sample polynucleotide.

                                                                                                                                                                                                                                                                                                                                                                                         8
                                                                                                                                                                                                                                                                                                                     셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a complex for promoting alteration of a target sequence in a cell, comprising a double stranded DNA sequence, a sequence in a cell, comprising a double stranded DNA sequence, a composed sequence of a complex is used in gene therapy. The homologous end joining. The invention is used in gene therapy. The complex is useful for promoting an alteration at a selected site of a target sequence of a cell preferably of fungal, plant or animal origin, or of vertebrate origin which is a primary or secondary mammalian (human) cell or an immortalised mammalian (human) cell, where target sequence comprises a mutation preferably point mutation having less than 10 base pairs which differ from wild-type sequence, (sealected from cystic fibrosis transmembrane requilator (CTRN) gene having mutation changes in an amino acid encoded by codon 508, beta-globin gene having mutation changes in an amino acid encoded by codon 2209 or 2229, Factor CTR gene, von Willebrand factor gene or xeroderma pigmentosa group G gene) can the DNA sequence comprises introducing an agent which is from Mable, while while while mutation. The method further comprises introducing an appear which inhibits a mismatch-repair protein (expression), which is from Mable, covalently linked to the DNA sequence, or to Rad52 protein or its inhibits expense or a sequince comprises introducing the complex into the cell, where the DNA sequence comprises a regulatory
                                                                                        ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Complex or composition comprising a double stranded DNA sequence, a homologous recombination-enhancing agent, and agent inhibiting non-homologous end joining, for promoting alteration of a target sequence in a cell.
                                                                                                                                                                                                                                                                                   Splice acceptor site which directs the splicing of one exon to another.
                                                                                                                                                                                                                                                                                                              Mutation; homologous recombination; target sequence; gene therapy; homologous recombination-enhancing agent; non-homologous end joining; therapeutic protein; splice acceptor site; ds.

of a targetted genomic sequence to produce a nomelogously recombinant cell and maintaining the homologously recombinant cell and maintaining the homologously recombinant cell and maintaining the homologously recombinant cell under conditions which permit expression of the protein coding sequence of the gene under control of the regulatory sequence. Homologously recombinant cell is useful as a vehicle or delivery system for therapeutic proteins, such as arrymes, hormones, cytchines, antigens, antibodies, clotting factors, arriterial proteins, novel (non-optimised) proteins and nucleic acid structural proteins, novel (non-optimised) proteins and nucleic acid products and engineered DNA and for supplying a therapoutic protein, including erythropoietin, calcitonin, growth hormone, insulin and insulinotropin. The present sequence is a splice acceptor site, used in the invention. This sequence directs the splicing of one exon to another
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a complex for promoting alteration of a target sequence in a cell, comprising a double stranded DNA sequence, a homologous recombination—enhancing agent and an agent inhibiting nonhomologous end joining. The invention is used in gene therapy. The complex is useful for promoting an alteration at a selected site of a target sequence of a cell preferably of fungal, plant or animal origin, or of vertebrate origin which is a primary or secondary mammalian (human) cell or an immortalised mammalian (human) cell, where target sequence comprises a mutation preferably point mutation having less than 10 base pairs which differ from wild-type sequence, (selected from cystic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Complex or composition comprising a double stranded DNA sequence, a homologous recombination-enhancing agent, and agent inhibiting non-homologous end joining, for promoting alteration of a target sequence in
maintaining the cell under conditions which permit alteration
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Splice acceptor site which directs the splicing of one exon to another.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Mutation; homologous recombination; target sequence; gene therapy; homologous recombination-enhancing agent; non-homologous end joining; therapeutic protein; splice acceptor site; ds.

Thorogate transmembrance requirator (CFTA) gene having mutation changes in an amino acid encoded by codon 6, Factor VIII gene having mutation changes in an amino acid encoded by codon 6, Factor VIII gene having changes in an amino acid encoded by codon 6, Factor VIII gene having mutation changes in an amino acid encoded by codon 2009 or 2229, Factor IX gene, von Willebrand factor gene or xeroderma pigmentosa group G gene)

CIX gene, von Willebrand factor gene or xeroderma pigmentosa group G gene)

CIX gene, von Willebrand factor gene or xeroderma pigment can correct the mutation. The method further comprises introducing an agent which inhibits a mismatch-repair protein (Expression), which is from Mah2, Mah6, Mah3, Mih1 and PMS2, or is an anti-mismatch-repair protein antibody covalently linked to the DNA sequence, or to Rad52 protein or its fragment. The complex is useful for altering expression of a protein coding sequence of a gene in a cell. The method comprises introducing the complex into the cell, where the DNA sequence comprises introducing to sequence to produce a homologously recombinant cell under conditions which permit alteration cof a targetted genomic sequence to produce a homologously recombinant cell is control of the regulatory sequence. Homologously recombinant cell is useful as a vehicle or delivery system for therapeutic proteins, such as crazmes, hormones, cytokines, antigens, antigens, antigens, receptors, antigens, reasses, hormones, cytokines, antigens, ranscription proteins, receptors, antigens, reasses, hormones, cytokines, antigens, transcription proteins, receptors, inclining arthernal proteins, and for supplying a therapeutic protein, inclining arthernal protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    including erythropoietin, calcitonin, growth hormone, insulin and insulinotropin. The present sequence is a splice acceptor site, used in the invention. This sequence directs the splicing of one exon to another
gene having mutation changes in

The sequence represents the complement of the human transforming growth factor-beta 1 promoter region gut-enriched Krueppel-like factor (GKLF) site. The invention relates to a novel isolated polymucleotide containing at least one single nucleotide polymorphism (SNP) at position 216 or 563 of TGF-betal, where the SNP is associated with a disease, condition or disorder. The polymucleotide has cytostatic, hypotensive, cardiant, vasotropic, antiatrerisoclarotic, antidiabetic, nephrotropic, antiatrerisoclarotic, antidiabetic, nephrotropic, antiatrerisoclarotic, and antiasthmatic activity. The polymucleotide may have a use in gene therapy. The method provided in the invention is useful for diagnosling genetic susceptibility for cancers, hypertension and a variety of other diseases. The polymucleotide is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                 Novel nucleic acid molecule comprising a single nucleotide polymorphism at a specified position in transforming growth factor-beta 1 promoter region, useful for diagnosing cancers, hypertension and other diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel nucleic acid molecule comprising a single nucleotide polymorphism at a specified position in transforming growth factor-beta 1 promoter
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    TGF-beta 1; transforming growth factor-beta 1; cytostatic; hypotensive; carddant; vasotropic; antiarteriosclerotic; antidiabetic; nephrotropic; antialcoholic; tranquilliser; antiasthmatic; gene therapy; cancer; hypertension; GKLF; gut-enriched Krueppel-like factor; de.

the production of pravastatin of the invention.

```
The sequence represents the complement of the human transforming growth factor-beta 1 promoter region gut-enriched Krueppel-like factor (GKLF) site. The invention relates to a novel isolated polynucleotide containing at least one single nucleotide polymorphism (SND) at position 216 or 563 of TGF-betal, where the SNP is associated with a disease, condition or vasotropic, antidateriosclerotic, antidabetic, hypotensive, cardiant, antidacholic, tranquilliser, and antiasthmatic activity. The polynucleotide may have a use in gene therapy. The method provided in the invention is useful for diagnosing genetic susceptibility for cancers, hypotension and a variety of other diseases. The polynucleotide is
                                                                                                                                                                                                                                                                                                        ö
region, useful for diagnosing cancers, hypertension and other diseases.
                                                                                                                                                                                                                                                                                                        Gaps

Pravastatin production related primer, P450R2

```
The invention relates to novel isolated pure DNA containing a gene participating in the biological conversion of mevastatin to pravastatin, its salt or its lactone ting-closed body or a mutant having a function of hybridizing with the gene under a stringent condition and giving the conversion activity to Streptomyces lividans. The invention further relates to an isolated pure DNA containing a gene participating in the biological conversion of mevastatin, its lactone ring-open body or its salt which can be prepared from a microbe of Microtestraspora genus to pravastatin, its salt or its lactone ring-closed body or a mutant having a function of hybridizing with the gene under a stringent condition and giving the conversion activity to Streptomyces lividans. The method is used for the preparation of pravastatin, its salt or its lactone ring-closed body. This polynucleotide sequence represents a primer relating to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       closed body. This polynucleoide sequence represents a primer relating to the production of pravastatin of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ó

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ò
```

The invention relates to novel isolated pure DNA containing a gene participating in the biological conversion of mevastatin to pravastatin, its salt or its lactone ring-closed body or a mutant having a function of hybridizing with the gene under a stringent condition and giving the conversion activity to Streptomyees lividans. The invention further relates to an isolated pure DNA containing a gene participating in the biological conversion of mevastatin, its lactone ring-open body or its salt which can be prepared from a microbe of Microtestraspora genus to be prepared from a microbe of Microtestraspora genus to a function of hybridizing with the gene under a stringent condition and giving the conversion activity to Streptomyces lividans. The method is used for the preparation of pravastatin, its salt or its lactone ring-closed body. This polynucleotide sequence represents a primer relating to

A DNA participating in the production of pravastatin, a recombinant plasmid, a transformant, production of pravastatin.

WPI; 2004-084761/09.

Example 1; SEQ ID NO 4; 15pp; Japanese.

A DNA participating in the production of pravastatin, a recombinant plasmid, a transformant, production of pravastatin.

comprises introducing a construct comprising the DNA sequence and a recombination region homologous to a consensus defined flanking region of a short interspersed repeated DNA enemt (SINB). e.g. the present sequence. The method may be used to modify the phenotype of cells, or investigate the response of receptors, metabolic pathways or expression products involved in the regulation of transcription or transduction of signals. It may also be used to produce protein products and transgenic animals, by providing novel capabilities to the cells or inhibiting endogenous capabilities, investigate physiological indications and screen cosmetics, foods and drugs. By using antisense sequences effective inhibition of both copies of a gene is possible, ensuring the substantial absence of the particular transcriptional or translational product. In providing for a capability in which the host is deficient
                                                                                                                                                                                                                                                                                                                                 Genomic integration of DNA by site directed recombination - using construct containing recombination region homologous to consensus defined flanking region of short interspersed repeated DNA element.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Integrating a DNA sequence into the genome of a vertebrate host cell,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Recombination region; consensus defined flanking region; short interspersed repeated DNA element; SINE; ss.

```
Integrating a DNA sequence into the genome of a vertebrate host cell, comprises introducing a construct comprising the DNA sequence and a recombination region homologous to a consensus defined flanking region of a short interspersed repeated DNA element (SINE), e.g. the present conventigate the response of receptors, metabolic pathways or expression products involved in the regulation of transcription or transduction of signals. It may also be used to produce protein products and transgenic confidence in the response of reapshilties to the cells or inhibiting endogenous capabilities, investigate physiological indications and screen committion of both copies of a gene is possible, ensuring the substantial absence of the particular transcriptional or translational product. In addition the method may enhance efficiency in gene therapy, when
                                                             Genomic integration of DNA by site directed recombination - using construct containing recombination region homologous to consensus defined flanking region of short interspersed repeated DNA element.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Genomic integration of DNA by site directed recombination - using construct containing recombination region homologous to consensus defined flanking region of short interspersed repeated DNA element.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            0; Indels

comprises introducing a construct comprising the DNA sequence and a recombination region homologous to a consensus defined flanking region of a short interspersed repeated DNA element (SIME), e.g. the present a short interspersed repeated DNA element (SIME), e.g. the present calls or investigate the response of receptors, metabolic pathways or expression products involved in the regulation of transcription or transduction of signals. It may also be used to produce protein products and transgenic animals, by providing novel capabilities to the cells or inhibiting consentics, foods and drugs. By using antisense sequences effective inhibition of both copies of a gene is possible, ensuring the substantial absence of the particular transcriptional or translational product. In addition the method may enhance efficiency in gene therapy, when
                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Amplifying desired regions of nucleic acid, especially exons from a genomic DNA sample, comprises using a partly-fixed consensus first primer and partly-fixed second primer, both having a sequence of randomized
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to a method for amplifying a region of the uncleic acid from a sample via PCR using several primers. The primers of the present invention have a region of fixed nucleotide sequence identical or complementary to a consensus sequence of interest and also have a region of randomised nucleotide sequence. The present sequence is primers for use in the present invention. The method is useful for specifically amplifying a desired region of a nucleic acid, especially exons from a sample of DNA. The method is also applicable for amplifying regions flanking a consensus sequence in a sample of nucleic acid of totally or partially unknown sequence
                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  3' splice junction consensus sequence used to design PCR primers.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to a method for amplifying a region of nucleic acid from a sample via PCR using several primers. The primers of the present invention have a region of fixed nucleotide sequence identical or complementary to a consensus sequence of interest and also have a region of randomised nucleotide sequence. The present sequence is the 3' splice junction consensus sequence, which was used to design PCR primers for use in the present invention. The method is useful for specifically amplifying a desired region of a nucleic acid, especially exons from a sample of DNA. The method is also applicable for amplifying regions flanking a consensus sequence in a sample of nucleic acid of

This invention describes a novel pharmaceutical composition which contains at least one polynucleotide, including at least one region that concains at least one polynucleotide, including at least one region that concorded a tumour antigen and an aqueous solvent and is used for treatment and prevention of cancer. The polynucleotide, the antigen-encoding region and/or the 5' and/or 3'-untranslated regions are modified, relative to composition to eliminate destabilising sequences. Preferably the stabilising sequences polynucleotides, at least one internal ribosome binding site and/or at least of uncleotides, at least one internal ribosome binding site and/or at least of a reabilising sequences. Preferably the stabilising sequences are untranslated regions of the beta-globin gene or a sequence of formula (C/U) CCAN x CCC(U/A) Py x UC(C/U) CC. The polynucleotide may also (i) are untranslated regions of the beta-globin gene or a sequence of formula (C/U) CCAN x CCC(U/A) Py x UC(C/U) CC. The polynucleotide may also (i) crosspound, e.g. proteamine, polyfuse a sequence that increases the transcription rate and is complexed, or condensed, with a (poly) cationic compound, e.g. proteamine, polyfuse or Arg) or histone. The composition may include (i) an RNase inhibitor, especially RNasin or (ii) many different nucleic acids, representing part of a cDNA library that encodes tumour-specific antigens. RNA avoids problems associated with use of DNA, induction of anti-DNA antibodies, but is normally too unstable for practical use. When stabilized, e.g. by incorporation of stabilizing sequence represents a sequence stabilising motif described in the disclosure of the invention have cytostatic activity. This sequence represents a sequence stabilising motif described in the sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

```
contains at least one polymucleotide, including at least one region that encodes a tumour antigen and an aqueous solvent and is used for treatment contains at least one polymucleotide, including at least one region that encodes a tumour antigen and an aqueous solvent and is used for treatment and or the 5' and/or 3'-untranalated regions are modified, relative to the wild type, to eliminate destabilising sequences. Preferably the collectide has a 5'-cap structure and/or a polym tall off at least 25 nucleotides, at least one internal inboome binding site and/or a least 25 and/or 3'-stabilising sequences. Preferably the stabilising sequences of contains and a complexed. The polymucleotide may also (i) are untranslated regions of the beta-globin gene or a sequence of formula (CVD)CCAN x CCC(U/A)Py x UC(C/U)CC. The polymucleotide may also (i) encode a cytokine or (ii) include a sequence that increases the transcription rate and is complexed, or condensed, with a (poly)cationic compound, e.g. protamine, poly[Us or Arg) or histone. The composition different nucled (i) an Rhase inhibitor, especially Rhasin or (ii) many different nucled activity respecially Rhasin or (ii) many condensed and into the genome; risk of viral recombination and induction of anti-DNA ancibodies, but is normally too unstable for induction of anti-DNA ancibodies, but is normally con unstable for practical use. When stabilized, e.g. by incorporation of stabilizing sequence or non-natural nucleotides, it provides an effective vaccine. The products of the invention have cytostatic activity. This sequence

This invention describes a novel in vitro method for selecting agents, present in a library of molecules, that bind to a target molecule. The method comprises first immobilizing the target molecules and contacting the target molecules and contacting the target molecule can bind to appropriate agents, forming a link of the target molecule can bind to appropriate agents, forming a link of structure reference complex-agent-target molecule. Non-bound components are separated and a force is applied to the link so that one bond in it is broken, and the target molecule-bound agent, or its complement, is identified and/or amplified. The reference complex has a binding strength chosen to be smaller than that of a specifically bound agent, when a tractive force is applied. The method is used to select specific-binding agents, potentially useful as pharmaceuticals, e.g. for activation or inhibition of targets, also for diagnosis. High-affinity but non-specific binding any present only rarely in the test population, since selection is made without reaching thermodynamic equilibrium. This results in rapid selection and does not require stringent conditions, i.e. selection conditions are similar to physiological conditions. This sequence invared.
                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 In vitro selection of specific binding agents, useful potentially as pharmaceuticals and diagnostic agents, discriminates again non-specific,
 represents a sequence stabilising motif described in the disclosure of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention describes a novel in vitro method for selecting agents, present in a library of molecules, that bind to a target molecule. The method comprises first immobilizing the target molecules and contacting attent experience complex agent target molecule. Non-bound components are separated and a force is applied to the link so that one bond in it is broken, and the target molecule-bound agent, or its complement, is identified and/or amplified. The reference complex has a binding strength chosen to be smaller than that of a specifically bound agent, when a gents, potentially useful as pharmaceuticals, e.g. for activation or inhibition of targets, also for diagnosis. High-affinity but non-specific binding are not selected, rather only those with appecific binding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        including any present only rarely in the test population, since selection is made without reaching thermodynamic equilibrium. This results in rapid selection and does not require stringent conditions, i.e. selection conditions are similar to physiological conditions. This sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                In vitro selection of specific binding agents, useful potentially as pharmaceuticals and diagnostic agents, discriminates again non-specific, high-affinity agents.

The invention relates to a method of identifying (M1) a peptide aptamer CC (PA) capable of modifying a cell phenotype, involving contacting a 1st sample of cells with a library of expressible nucleic acid sequences encoding random peptide aptamers linked to a fusion moiety, selecting at encoding random peptide aptamers linked to a fusion moiety, selecting at contacting, and identifying peptide aptamers expressed in the selected cell. PA, its derivative or corresponding expressible contacting to contacting of an agent having similar binding in the selected cell. PA, its derivative or corresponding expressible contacteristics as PA. PA, its derivative or corresponding expressible contacting is useful for treating or inhibiting a disease or condition such as cancer) associated with an aberrant cell phenotype in associated with a definition, protein trafficking, cell adhesion, membrane transport, cell motility, metabolic state or differentiation, when compared to a control cell, or the aberrant cell chenotype is associated with a tumor cell. The expressible nucleic acid is administered using a retrovirus that comprises a chromatin insulator cellement. PA is useful as a prognostic or disposit coll, for altering a cell phenotype, in gene therapy, as therapeutics for treating diseases (such as pain, epilepsy, stroke, parkinson's disease, Alzheimer's cellement of other therapeutics. This sequence represents the generic sequence used to generate the aptamers of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Identifying peptide aptamer capable of modifying cell phenotype, by contacting cell sample with library encoding random peptide aptamers, selecting cell with altered phenotype, and identifying aptamers expressed

The invention relates to a method of identifying (MI) a peptide aptamer CC (PA) capable of modifying a cell phenotype, involving contacting a let cample of cells with a library of expressible nucleic acid sequences canoding random peptide aptamers linked to a fusion moiety, selecting at least one cell having an altered phenotype compared to the phenotype of the cell prior to contacting, and identifying peptide aptamers expressed in the selected cell. PA, its derivative or corresponding nucleic acid is useful for the molecular modelling of an agent having similar binding contargued as PA, PA, its derivative or corresponding expressible contargued as cancer) associated with an aberrant cell phenotype in a subject, where the aberrant cell phenotype is associated with a change in levels of apoptosis, viral resistance, signal transduction, protein trafficking, cell adhesion, membrane transport, cell motility, metabolic state or differentiation, when compared to a control cell, or the aberrant cell phenotype is associated with a tumor cell. To the abersable nucleic acid is administered using a retrovirus that comprises a chromatin insulator cell phenotype, in gene therapy, as therapeutics for iterating diseases (such as pain, epilepsy, stroke, Parkinson's disease, Alabiemer's cell phenotype, in gene therapy, as therapeutics for treating diseases thutnington's disease, multiple sclerosis, Albsimer's cesarch and development of other therapeutics. This sequence represents crearact and used to generate the aptemers of the invention.

Determination of this BAC-end sequence was carried out as part of a collaboration with the European Drosophila Genome Project (EDGP) - http://www.adgp.ebi.ac.uk - . This Drosophila melanogaster BAC library (Dros BAC) was made by Alain Billaud at CEPH (Centre d'Etude du Polymorphisme Humain) with funding provided by a MRC project grant. The DNA was prepared from embryos by Alain Bucheton and Genevieve Payan. It has been constructed in the vector

Analysis of 2166 clones from a human colorectal cancer cDNA library by partial sequencing Hum. Mol. Genet. 4, 37-43 (1995)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Email: dagornmarrhur.citi2.fr
This sequence is one of a series obtained by systematic sequencing
of a colorectal cancer cDNA library.
Seq primer: M13 Forward.

Submitted (123-JUL-1999) Genoscope - Centre National de Sequencage : Submitted (123-JUL-1999) Genoscope - Centre National de Sequencage : BP 191 91006 EVRY cedex - FRANCE (E-mail : seqref@genoscope.cns.fr Determination of this BAC-end sequence was carried out as part of a collaboration with the Buropean Drosophila Genome Project (EDGP) - http://www.edgp.ebi.ac.uk -. This Drosophila melanogaser BAC library (Dros BAC) was made by Alain Billaud at CEPH (Centre d'Etude du Polymorphisme Humain) with funding provided by a MRC project grant. The DNA was prepared from embryos by Alain Bucheton and Genevieve Payan. It has been constructed in the vector

Determination of this BAC-end sequence was carried out as part of a collaboration with the Buropean Drosophila Genome Project (EDGP) - http://www.edgp.ebi.ac.uk -. This Drosophila melanogaster BAC library (Dros BAC) was made by Alain Biland at CEPH (Centre di Stude du Polymorphisme Humain) with funding provided by a MRC project grant. The DNA was prepared from embryos by Alain Bucheton and Genevieve Payan. It has been constructed in the vector

Determination of this BAC-end sequence was carried out as part of a collaboration with the European Drosophila Genome Project (EDGP) - http://www.edgp.ebi.ac.uk -. This Drosophila melanogaster BAC library (Dros BAC) was made by Alain Billaud at CEPH (Centre Project grant. The DNA was prepared from embryos by Alain Bucheton and Genevieve Payan. It has been constructed in the vector
